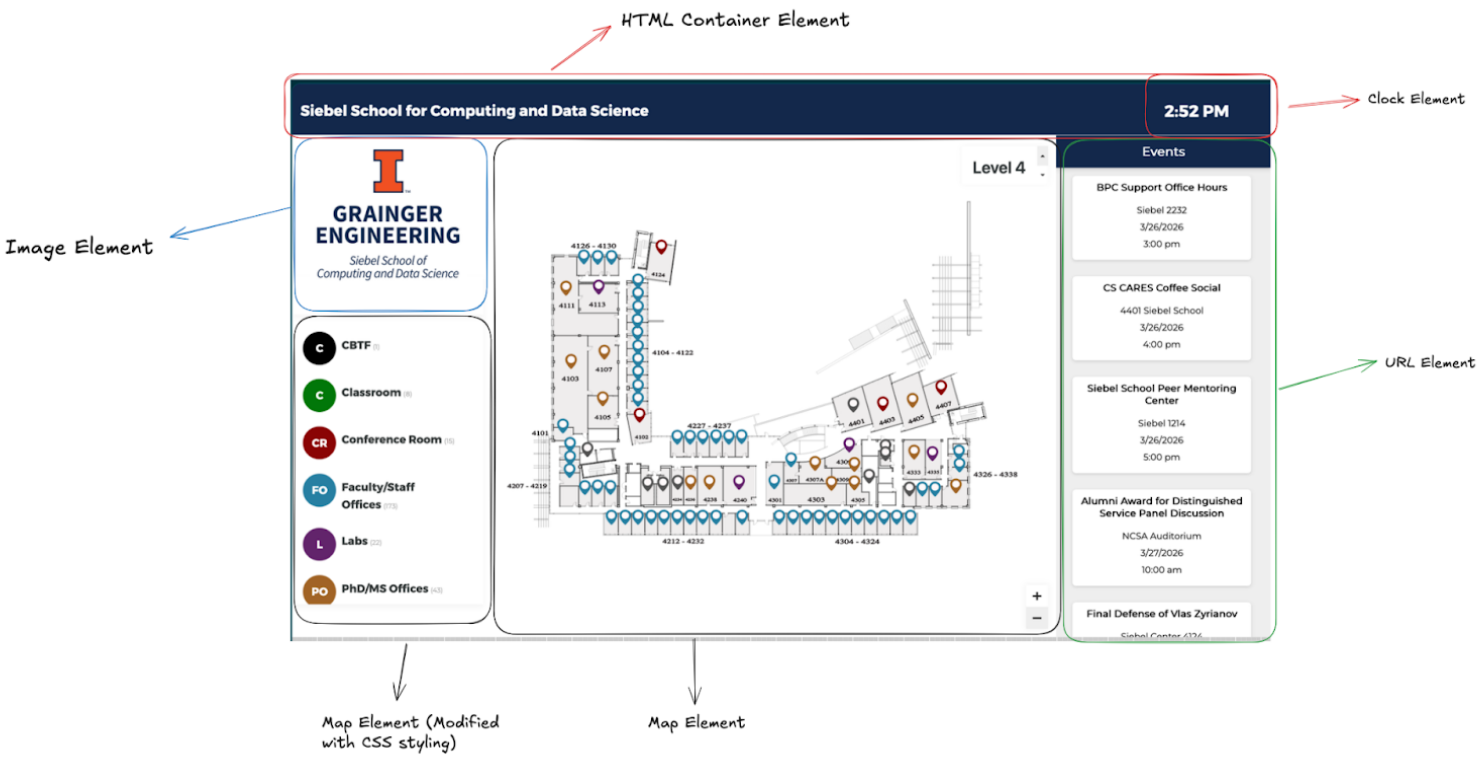
Siebel School Navigational Kiosk (Korbyt)



This final visual was created using a Korbyt layout with the following elements:

- Header consists of HTML Container Element and Clock Element
- Left sidebar consists of Image Element and the sidebar from the Map Element
- Middle is a Map Element
- Right sidebar is a URL element

To complete this, I used Adobe Illustrator, Python, and JavaScript, but I think it's possible to achieve a similar result with only Adobe Illustrator or some other vectorized image editor.

Header

Title + Blue Bar

This is a piece of custom code in an HTML container since the text element wouldn't stretch the width of the screen easily. The background color comes from my custom CSS, which is explained further in Sidebar > Map Categories + CSS Styling

Code for HTML container:

```
<header>
  <h1 style="font-family: Montserrat"> Siebel School for Computing and
Data Science</h1>
</header>
```

Clock

Korbyt Clock element, layered on top of the HTML container. (Z-score must be higher than HTML container Z-score)

Map

Floor Plans

Requirements:

- SVG files, one for each floor of the building. Resize all files so they have the same dimensions, if necessary.

To make finding the x and y coordinates easier, I put transparent circles over each room in Adobe Illustrator and extracted the x,y coordinates of the center point. I extracted these values from the SVG files using Python, but there's likely another way to do this without it.

Upload the files to Korbyt Media Manager in a place where you can easily find them again.

Data Files

Room data should be in a CSV file with the following column names and values:

- "id" → The unique identifier for the room (e.g. SC1111)
- "x" → The x-coordinate for the room on the SVG file (where the map pin should go)
- "y" → The y-coordinate for the room on the SVG file (where the pin should go)
- "level_id" → Which floor the room is on (in the format 0_0_level_0)
- "category" → Misleadingly, must be a number that matches the ID of the category as defined below
- "type" → Must be one of these:
- "title" → The name of the room
- "description" → Secondary information about the room
- "about" → ???
- "custom_image" (string) → A url to an image (I have never used this or gotten it to work)
- "status" (boolean) → True or False, true meaning the room is shown on the map, false otherwise

Room category data should be in a CSV file with the following column names and values:

- "id" → ID number for the category
- "title" → The name of the category

- “about” → ???
- “color” → Hexcode for the category color

Korbyt Data Adapter

Note: Student Affairs Technology has informed me that Korbyt Data Adapters will not support data tables with more than 250 rows. This results in data being lost in the final version, e.g. rooms being dropped.

1. Upload CSV(s) to Media Manager
2. Integrations > Create Adapter
3. Adapter Type: Template
4. Select CSV data adapter template
5. Replicate in cloud: yes
6. Template configuration
    a. Choose your csv file by clicking Media Library File
    b. Data delimiter character (for csv): ,
    c. String quote character (maybe depends on your file): “
    d. String escape character (for csv): \
    e. Refresh interval: 15:00
    f. Lines to skip (the number of header rows in file): 1
    g. Remove missing keys: True
    h. Click define DB table → Examples provided below
7. Save & Create, wait at least 5 minutes for all the data to load, then click the “Active” slider at the top of the screen
8. Click the preview button (eye) to make sure all the data loaded correctly
9. Repeat Steps 1-8 for the category data

Example Building Data Table

Item	Data Type	Size	Primary Key
id	string	255	True
x	float		False
y	float		False
level_id	string	255	False
category	string	255	False
type	string	255	False
title	string	255	False

Item	Data Type	Size	Primary Key
description	string	255	False
about	string	255	False
custom_image	string	255	False
status	boolean		False

Example Category Data Table

Item	Data Type	Size	Primary Key
id	string	255	True
title	string	255	False
about	string	255	False
color	string	255	False

Sidebar

Image

A (mostly) square image I used to cover up the gap left by pushing the category sidebar to the bottom of the screen.

Map Categories + CSS Styling

The sidebar needed to be contained within 48” of the ground to be compliant with ADA regulations, so I had to make the sidebar much shorter than it normally would be. I also hid the category and people buttons, since there’s no keyboard available to type in names.

In Advanced > Open Editor > CSS Editor, copy and paste the following to hide these buttons and adjust the sidebar height:

```
body {
  font-family: "Montserrat", sans-serif;
}
.element.Map .mapplic-filter .material-icons {
     margin-bottom: 4vmin;
}
```
